# Gene expression under human self-domestication: an *in silico* exploration of modern human high-frequency variants

Thomas O'Rourke<sup>1</sup>✉, Pedro Tiago Martins<sup>1,2</sup>, Alejandro Andirkó<sup>1\*</sup>  
<sup>1</sup>University of Barcelona, <sup>2</sup>University of Ljubljana

## Introduction

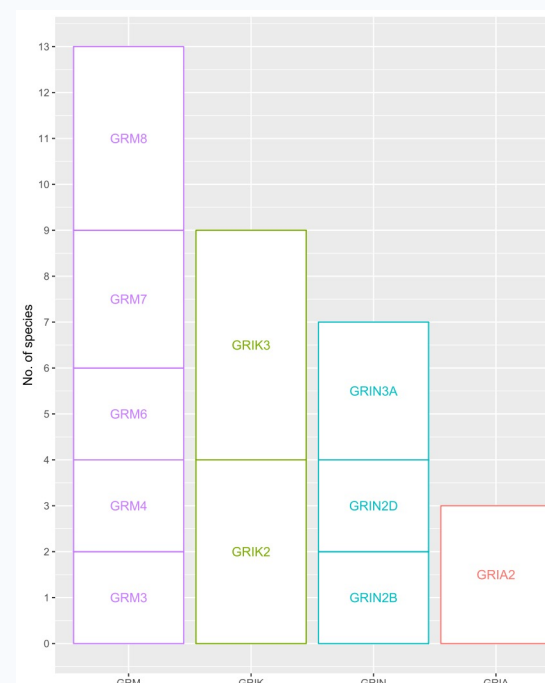

(adapted from Theofanopoulou et al. 2017, *PLoS ONE*)

### Differences:

Braincase shape & size, browridge,  
nasal bone, tooth size, jaw progression

(O'Rourke & Boeckx 2020, *Neurosci. Biobehav. Rev.*)

## Hypothesis

- Downregulated glutamatergic synaptic activity

## Methods

- Gene expression values per high-freq/fixed variant ([ExPecto](#))
- Genes in glut. signaling pathway (based on GO category [0098978](#))
- Tissues: blabla out of 228 in ExPecto

## Results
